Garden-path sentences and human parsing

Garden-path sentences

Definition

A *garden-path* sentence is a sentence which is grammatically correct and unambiguous, but which forces the reader to initially adopt a wrong syntactic parse.

Garden-path sentences

Definition

A *garden-path* sentence is a sentence which is grammatically correct and unambiguous, but which forces the reader to initially adopt a wrong syntactic parse.

Examples

The employees understood the contract would change

Garden-path sentences

Definition

A *garden-path* sentence is a sentence which is grammatically correct and unambiguous, but which forces the reader to initially adopt a wrong syntactic parse.

Examples

The employees understood the contract would
change

Garden-path sentences

Definition

A *garden-path* sentence is a sentence which is grammatically correct and unambiguous, but which forces the reader to initially adopt a wrong syntactic parse.

Examples

The employees understood the contract would change

Because the employees negotiated the contract would change

Garden-path sentences

Definition

A *garden-path* sentence is a sentence which is grammatically correct and unambiguous, but which forces the reader to initially adopt a wrong syntactic parse.

Examples

The employees understood the contract would change

Because the employees negotiated the contract would change

Garden-path sentences

Definition

A *garden-path* sentence is a sentence which is grammatically correct and unambiguous, but which forces the reader to initially adopt a wrong syntactic parse.

Examples

NP/S The employees understood the contract would change

Because the employees negotiated the contract would change

Garden-path sentences

Definition

A *garden-path* sentence is a sentence which is grammatically correct and unambiguous, but which forces the reader to initially adopt a wrong syntactic parse.

Examples

NP/S The employees understood the contract would change

Because the employees negotiated the contract would change

Garden-path sentences

NP/S The employees understood the contract would change

NP/Z Because the employees negotiated the contract would change

The psycholinguistics theories

The _

The psycholinguistics theories

The employees _

The psycholinguistics theories

The employees understood

The diagram illustrates the parsing of the sentence "The employees understood". It features three curved arrows above the text. The first arrow starts above "The" and points to "employees". The second arrow starts above "employees" and points to "understood". The third arrow starts above "understood" and loops back to point to "employees", representing a reanalysis or correction in parsing.

The psycholinguistics theories

The employees understood the _

The diagram illustrates the parsing of the sentence "The employees understood the _". It shows four words: "The", "employees", "understood", and "the". Above the words, there are four curved arrows representing the flow of information. The first arrow starts above "The" and points to "employees". The second arrow starts above "employees" and points to "understood". The third arrow starts above "understood" and points to "the". The fourth arrow starts above "the" and points back to "understood", forming a loop. This loop indicates a re-interpretation of the sentence structure, where the initial interpretation of "understood" as a transitive verb is revised when the sentence ends with "the _".

The psycholinguistics theories

The employees understood the contract

Computational models of human behaviour

Predictions in human behaviours

- ▶ Words that are predictable (in context) are read more easily

Predictions in human behaviours

- ▶ Words that are predictable (in context) are read more easily

Example:

1. The boat passed easily under the ...
2. Rita slowly walked down the shaky ...

Predictions in human behaviours

- ▶ Words that are predictable (in context) are read more easily

Example:

1. The boat passed easily under the **bridge**
2. Rita slowly walked down the shaky **bridge**

Predictions in human behaviours

- ▶ Words that are predictable (in context) are read more easily

Example:

1. The boat passed easily under the **bridge**
 2. Rita slowly walked down the shaky **bridge**
- (“*bridge*” in 1. read faster than “*bridge*” in 2.)

Definition

The surprisal of a word w_n in the context $w_1 \dots w_{n-1}$ is given by:

$$S(w_n) = -\log_2 (P [w_n | w_1 \dots w_{n-1}])$$

Definition

The surprisal of a word w_n in the context $w_1 \dots w_{n-1}$ is given by:

$$S(w_n) = -\log_2 (P [w_n | w_1 \dots w_{n-1}])$$

Example: in 1. the surprisal of **bridge** is:

$$-\log_2 (P [\text{bridge} | \text{The boat passed easily under the}])$$

Definition

The surprisal of a word w_n in the context $w_1 \dots w_{n-1}$ is given by:

$$S(w_n) = -\log_2 (P [w_n | w_1 \dots w_{n-1}])$$

Example: in 1. the surprisal of **bridge** is:

$-\log_2 (P [\text{bridge} | \text{The boat passed easily under the}])$

- ▶ Works well in naturalistic sources (e.g. newspapers, novels, etc.)

Computational models based on surprisal

Definition

The surprisal of a word w_n in the context $w_1 \dots w_{n-1}$ is given by:

$$S(w_n) = -\log_2 (P [w_n | w_1 \dots w_{n-1}])$$

Example: in 1. the surprisal of **bridge** is:

$-\log_2 (P [\text{bridge} | \text{The boat passed easily under the}])$

- ▶ Works well in naturalistic sources (e.g. newspapers, novels, etc.)
- ▶ Fails for rarer constructions

Definition

The surprisal of a word w_n in the context $w_1 \dots w_{n-1}$ is given by:

$$S(w_n) = -\log_2 (P [w_n | w_1 \dots w_{n-1}])$$

Example: in 1. the surprisal of **bridge** is:

$-\log_2 (P [\text{bridge} | \text{The boat passed easily under the}])$

- ▶ Works well in naturalistic sources (e.g. newspapers, novels, etc.)
- ▶ Fails for rarer constructions
e.g. **garden-path sentences**

Failures of surprisal

Failures of surprisal

The Signalling Fraction (SF) (General case)

The Signalling Fraction (SF) (General case)**Definition**

Given $d = \{d_1, d_2\}$, we define SF to the minimal $\lambda \in [0, 1]$ s.t. $\exists d_{NS}$ consistent and d' (not necessarily consistent) s.t.:

$$d = (1 - \lambda) \cdot d_{NS} + \lambda \cdot d'$$

The Signalling Fraction (SF) (Example)

The Signalling Fraction (SF) (Example)

SF is the minimal λ s.t.:

$$d = (1 - \lambda) \cdot d_{NS} + \lambda \cdot d'$$

where: $d_{NS, \text{The employees understood}} \Big|_{\text{The employees}} = d_{NS, \text{The employees}}$

Interpretation of SF

Low SF (mostly consistent)

Interpretation of SF

Low SF (mostly consistent) \Rightarrow Low need for reanalysis

Interpretation of SF

Low SF (mostly consistent) \Rightarrow Low need for reanalysis

High SF (highly inconsistent)

Interpretation of SF

Low SF (mostly consistent) \Rightarrow Low need for reanalysis

High SF (highly inconsistent) \Rightarrow High need for reanalysis

Interpretation of SF

Low SF (mostly consistent) \Rightarrow Low need for reanalysis

High SF (highly inconsistent) \Rightarrow High need for reanalysis

\Rightarrow Should have a correlation between reading difficulty (reading times) and SF

Conclusion

Summary of the results

- ▶ Created a presheaf model of the human parsing process, which is close to the theories of psycholinguistics

Summary of the results

- ▶ Created a presheaf model of the human parsing process, which is close to the theories of psycholinguistics
- ▶ We used a measure of “sheafness” SF to quantify the difficulty of parsing words in a sentence

Summary of the results

- ▶ Created a presheaf model of the human parsing process, which is close to the theories of psycholinguistics
- ▶ We used a measure of “sheafness” SF to quantify the difficulty of parsing words in a sentence
- ▶ We obtained good correlations between SF and reading times

Summary of the results

- ▶ Created a presheaf model of the human parsing process, which is close to the theories of psycholinguistics
- ▶ We used a measure of “sheafness” SF to quantify the difficulty of parsing words in a sentence
- ▶ We obtained good correlations between SF and reading times
- ▶ We managed to obtain statistically differences between predictions from garden-path sentences which have different levels of difficulty

Summary of the results

- ▶ Created a presheaf model of the human parsing process, which is close to the theories of psycholinguistics
- ▶ We used a measure of “sheafness” SF to quantify the difficulty of parsing words in a sentence
- ▶ We obtained good correlations between SF and reading times
- ▶ We managed to obtain statistically differences between predictions from garden-path sentences which have different levels of difficulty
- ▶ We compared our results with the state-of-the-art methods from computational linguistics, and obtained more accurate predictions

- ▶ Add more structure to the presheaf (e.g. include semantic information)

Future work

- ▶ Add more structure to the presheaf (e.g. include semantic information)
- ▶ Combine approaches using SF and surprisal

Future work

- ▶ Add more structure to the presheaf (e.g. include semantic information)
- ▶ Combine approaches using SF and surprisal
- ▶ Produce models of the reanalysis process

Future work

- ▶ Add more structure to the presheaf (e.g. include semantic information)
- ▶ Combine approaches using SF and surprisal
- ▶ Produce models of the reanalysis process
- ▶ Use this model to investigate other linguistic phenomena (e.g. memory effects)

Future work

- ▶ Add more structure to the presheaf (e.g. include semantic information)
- ▶ Combine approaches using SF and surprisal
- ▶ Produce models of the reanalysis process
- ▶ Use this model to investigate other linguistic phenomena (e.g. memory effects)
- ▶ Contextuality with $k < \infty$ -lookback?
